

## Introduction

---

AVM Biotechnology, located in Seattle, WA, was founded in response to growing concerns about the need for safe, effective, affordable and ethical medicines and therapeutic treatments.

Within our communities, regardless of their political, cultural, social or religious beliefs, families are becoming increasingly concerned about how our medicines and health care treatments are being developed. They are questioning the safety, the lack of ethical standards, the types of human cells being used, the risks these human cells present, and how certain human cell types are being utilized in the production of drugs.

Simple questions are often countered with complicated scientific jargon and misleading terminology, rather than with straight, honest answers.

Coming together to form AVM Biotechnology in order to address these issues, leading scientists, business and community activists and policy makers agreed that they would take on the following tasks:

- Focus on providing true medical benefits from economical stem cell research that is respectful to human life and the taxpayers' dollar.
- Educate the public on the important difference in the safety and efficacy of adult and cord blood stem cells, versus embryonic and aborted fetal stem cells.
- Provide direct answers to questions and concerns in easily understood language.
- Work to provide safe, effective and affordable alternative vaccines and stem cell therapies that are not tainted by embryonic or electively aborted fetal materials.
- Establish a comprehensive and diverse assemblage of advisors, ambassadors, scientists, medical professionals, politicians, policy makers, academics and supporters who will educate and engage the general public on the issues and answers.

**At AVM Biotechnology, we know there is a better way.**

## Company

---

AVM Biotechnology was the brainchild of Dr. Theresa Deisher, internationally renowned stem cell research scientist with over 20 pharmacology and research patents, who realized the great need to address:

- The moral, ethical, and economic quagmire caused by the misuse of the public's trust in the stem cell debate.
- The ethical dilemma created for many because of the mandatory vaccination requirements in the U.S. which currently are only met through the use of electively aborted fetal material.
- The potential public health consequences in the United States where some estimate that as high as 12% of parents are now choosing to avoid vaccinations that protect our children and society, due to the perception of a link between vaccination and increases in autism and auto-immune diseases.

In 2008, AVM Biotechnology was founded by a small team of dedicated professionals who know there is a better and safer way to produce life saving medicines. At AVM, we are committed to providing commercially available or clinically proven ethical vaccine and stem cell alternatives to parents, families, medical professionals, hospitals, health care organizations, and taxpayers.
